DETAILED ACTION

1. Applicant's after-final amendment was received on 10/21/2006, and has been entered and made of record. Currently, claims **8, 9** and **14** are pending. The examiner notes that the applicant has elected to cancel claims **1, 3-7, 10-13** and **15-18**.

Allowable Subject Matter

2. Claims 8, 9 and 14 are allowed.

Examiner's Statement of Reasons for Allowance

3. The following is an examiner's statement of reasons for allowance: The examiner notes that the independent claim features warranting allowability are listed as follows:

A command data conversion device for use in a printing system, comprising: a processor that receives multiple image data sets corresponding to multiple inks used in the printing system and performs prescribed processing; a counter that counts a number of the image data sets received by the processor; and ink color data registers that store multiple ink color data indexes indicating which of multiple inks is to be used, and into which the multiple ink color data indexes may be written at least when the command data conversion device is manufactured, and wherein the processor generates data by adding to each of the image data sets a corresponding one of the ink color data indexes stored in the registers in accordance with a value of the counter when each of the image data sets is received.

The examiner notes that most relevant cited art is Maeda et al. (US 5,899,614) and Ando (EP 0945780). Maeda discloses an output apparatus comprising a substituting circuit for substituting discrimination information to be changed in

Application/Control Number: 09/849,304

Art Unit: 2625

accordance with the input of instruction information, and a command table of an output unit which can be rewritten at execution time. Ando discloses a printer control circuit capable of converting control commands pertaining to color printing and sending said data to a printer. In this print command communication process RGB color data is converted to CMYK raster data and stored in buffer memory at the control circuit before being sent to a printer.

Neither Maeda nor Ando disclose a device with a counter that counts a number of the image data sets received by the processor; and ink color data registers that store multiple ink color data indexes indicating which of multiple inks is to be used, and into which the multiple ink color data indexes may be written at least when the command data conversion device is manufactured, and wherein the processor generates data by adding to each of the image data sets a corresponding one of the ink color data indexes stored in the registers in accordance with a value of the counter when each of the image data sets is received.

Therefore, the examiner views the applicant's invention to be patentably distinct over the cited references.

Any comments considered necessary by applicant must be submitted no later 4. than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
